

Activity 5-2 – Form

1. Try the following code:

```
class TestLoginForm extends React.Component {
  constructor(props) {
    super(props);

    // handle initialization activities
  }
  handleChangeEvents(event) {
    //handle change events
  }
  handleSubmitevents(event) {

    // handle submit events
  }
  handlePasswordChange(event){

    //handle password change events
  }
  render() {
    return (
      <div className=" TestLoginForm ">
        <form onSubmit={this.handleSubmitevents}>
        {

          //handle error condition
        }

        <label>User Name</label>

        <input type="text" data-test="username" value={this.state.username}
          onChange={this.handleChangeEvents} />

        <label>Password</label>

        <input type="password" data-test="password" value={this.state.password}
          onChange={this. handlePasswordChange } />

        <input type="submit" value="Log In" data-test="submit" />

      </form>
    );
  }
}
```
