

Activity 3-1 – State and Prop in react

Inside the component you can use props as any regular JavaScript variable. You can render conditionally, or you even pass down props to other components

1. Try the following code:

```
import React from 'react';
import {render} from 'react-dom';
class ManagedControlDemo extends React.Component {
  constructor(props) {
    super(props);
    this.state = {message: ""};
  }
  handleChange(e) {
    this.setState({message: e.target.value});
  }
  render() {
    return (

      <div>
        <legend>Type something here</legend>
        <input
          onChange={this.handleChange.bind(this)}
          value={this.state.message}
          autoFocus />
        <h1>{this.state.message}</h1>
      </div>

    );
  }
}
```
